Climate change

The Earth is Warming
97% of scientists agree that human behavior is increasing greenhouse gases and causing global temperatures to rise.

Impacts are serious
Around the world we are seeing unprecedented mega-storms, sea level rise, flooding, and famine resulting in hundreds of thousands of climate refugees. Locally we are seeing heat waves, drought, and forest fires.

We’re causing it
Inefficient transportation, high energy use, food waste all point to a need for reduced resource consumption and more sustainable living.

We can fix it
Climate change is a solvable problem. Be a part of the solution. The next big idea is out there. Human Innovation, invention and the will to survive are some of our greatest resources.

We need you
No single person’s actions can stop climate change, but if everyone starts living more sustainably, it will have a profound effect. Use your voice, and your dollars, to make a choice for a livable future.
